**Plant:** *Echinacea purpurea* L.

Purple coneflower (*Echinacea purpurea* L.) is a perennial plant with fine, branched roots that give rise to a solid, branched stem. The original habitat of *Echinacea* is in the Central and Southern United States. Some species are widespread, such as *Echinacea angustifolia*, *Echinacea purpurea* and *Echinacea pale*, while other species such as *Echinacea laevigata*, *Echinacea tennesensis* or *Echinacea paradoxa* grow in very well-defined regions. *Echinacea tennesensis* is on the list of plants at risk of extinction. *Echinacea purpurea* prefers moist, shaded soils such as forest edges, slopes and plains, up to an altitude of 1.5

meters. Some counterfeit Echinacea products have been detected, however, containing Parthenium integrifolium.

The leaves and roots are widely used in phytotherapy to make herbal teas, juices, creams and injectable remedies.

Echinacea was one of the main medicinal plants of the North American Indians, particularly the Cheyenne, Sioux, Kiowas, Crows, Omahas, Pawnee, Poncas, Tetons, Delawares and Comanches. They used the juice or a paste of the plant, its roots in pieces or crushed as a potential remedy.
