EAN: 8420101216728 FABRICANTE: ELADIET

Local application cream with cannabidiol, arnica, harpagofito, willow and St. John's wort.

DESCRIPTION

What is Regendol Cannabis Cream and what is it for?

Regendol Cannabis cream contains several ingredients, each with its own properties and benefits. The ingredients and what the cream is for in general:

1. **Cannabidiol (CBD):** Cannabidiol is a compound derived from cannabis that relieves pain and reduces inflammation. It has no psychoactive properties, so it won't make you feel "high." CBD is believed to interact with the body's endocannabinoid system to promote pain relief and muscle relaxation.
2. **Arnica:** Arnica is a plant that has traditionally been used in natural medicine to reduce inflammation and relieve muscle and joint pain.
3. **Harpagophyte:** Also known as "devil's claw," harpagophyte is a plant that has been used to treat pain in musculoskeletal conditions, such as arthritis.
4. **Willow:** Willow is a natural source of salicylic acid, which is the precursor to aspirin. It has anti-inflammatory and analgesic properties, so it can help relieve pain.
5. **St. John's wort:** St. John's wort, also known as St. John's wort, has been used to treat conditions such as neuralgia and muscle pain.

Altogether, this cream is formulated to provide localized relief to muscles and joints. The CBD and the other ingredients work together to reduce inflammation and relieve pain, while the heating effect can help relax muscles and increase blood circulation in the treated area, which in turn can contribute to pain relief.
