

Artrion Silicon Complex 1 l

EAN: 8437011373458 FABRICANTE: JELLYBELL

Artrion Silicon Complex by Jellybell is a supplement that, thanks to its powerful antioxidant properties, is ideal against free radicals. It is a tissue regenerator, increases the synthesis of macromolecules in the extracellular matrix of cartilage, and forms the structure of the tissues of the locomotor system.

DESCRIPTION

Amount provided per daily dose (30 ml): 750 mg Lemon concentrate, 750 mg Cassis concentrate, 500 mg Glucosamine sulphate, 500 mg MSM (methylsulfonylmethane), 500 mg Chondroitin sulphate, 150 mg Collagen, 100 mg Boswellia dry extract, 46.3 mg Silicon dioxide (provides 21 mg of Silicon), 10 mg Sodium hyaluronic acid.

Lemon Concentrate

Among the main virtues of this food are its powerful antioxidant properties, capable of preventing the negative activity of free radicals. Lemon contains almost 30 antioxidant components in addition to vitamin C, such as the flavonoids rutin, hesperidin, naringenin and lutein; beta-carotenes; and caffeic, ferulic or gamma terpinene acids.

Its broad chemical composition gives it multiple uses.

Among them, lemon is one of the best blood purifying remedies by helping to eliminate toxins from the blood.

It has the ability to improve digestion.

Cassis Concentrate

It has a high content of flavonoids, pectin, tannins as well as vitamin C, vitamin B and minerals such as calcium, copper, phosphorus, potassium.

They also provide essential fatty acids for our body such as Linoleic Acid and Gamma-linolenic Acid.

Traditionally used as an anti-inflammatory and diuretic.

Glucosamine Sulfate

Glucosamine sulfate is a substance found in our body, it is present in the fluid surrounding the joints. It is useful for osteoarthritis and osteoarthritis problems.

MSM Methylsulfonylmethane

MSM corresponds to Methyl-Sulfenyl-Methane and represents inorganic sulfur in its natural form, that is, as we find it in the sea, in the ground and in the atmosphere. Its presence in the human body is fundamental, since it represents the basis for the construction of the most important biomolecular structures, such as enzymes, amino acids, hormones and it takes part in the most essential metabolic processes of cells. Therefore, there are many functions that it performs, including the anti-inflammatory effect, thanks to which the organism is able to effectively repair damaged cells and tissues. All of this makes MSM a valid support against joint pain, tendonitis, inflammation of the mucous membranes or problems with the intervertebral disc and, generally, in the presence of musculoskeletal pathologies. MSM is also used in sports: athletes often suffer from stiffness and pain in ligaments, muscles or joints; constant administration helps in these contexts. Recent studies on humans indicate that organic MSM levels tend to decrease with age, probably due to the incipient metabolic slowdown. Therefore, proper supplementation is necessary, especially in old age.

Chondroitin Sulfate

Chondroitin sulfate is a substance normally found in the cartilage around joints. Chondroitin sulfate is made from animal sources, such as shark, cow, or pig cartilage. Chondroitin sulfate is useful for osteoarthritis problems.

Collagen

It is a tissue regenerator, increases the synthesis of macromolecules in the extracellular matrix of cartilage, forms the structure of the tissues of the locomotor system. It provides flexibility in the circulatory system, among others.

Boswellia

Boswellia has an anti-inflammatory effect, it is especially interesting when it comes to helping and preventing joint pain, joint discomfort is often caused by inflammation of the tissue that forms the joints. Boswellia is often used in the treatment of chronic diseases such as rheumatoid arthritis or osteoarthritis, as well as in some bowel diseases. Clinical studies have been done for knee osteoarthritis. The text of SILICON DIOXIDE is also missing, to say: Silicon dioxide is a compound of silicon and oxygen which is commonly called silica. In order to keep bones and joints healthy, you can take advantage of the health benefits of silicon dioxide. When nails are brittle, silicon dioxide may be enough to recover them and keep them healthy.

Sodium Hyaluronic Acid

Hyaluronic acid contains 90% glycosaminglycan polysaccharides (GAGs) and is characterized by its great capacity to retain water. In our body, it is a natural element of synovial fluid and acts in the joints as a lubricant for cartilage and ligaments, and also acts as a protector against mechanical forces. Hyaluronic acid is absorbed and distributed in the connective tissue.

Hyaluronic acid helps reduce pain and increases the viscosity of synovial fluid, thereby improving joint function.

Instructions for use: Take 30 ml (=1 measuring cup) of product diluted in 200 ml of water in the morning on an empty stomach.
