EAN: 8437011373212 FABRICANTE: JELLYBELL

Phosphorus and Potassium compounds participate in the formation of all the tissues and fluids of the body, especially those of the brain, nervous system, spinal cord and hematocrit.

DESCRIPTION

Phosphorus and Potassium compounds participate in the formation of all the tissues and fluids of the body, especially those of the brain, nervous system, spinal cord and hematocrit.

Our brain, spinal cord and nervous system create substances that retain and protect these two chemical elements. A small deficiency can cause major disorders, especially in the neuro-psychological field.

It acts on the hematocrit and is nature's great ANTISEPTIC.

K acts directly on the adrenal cortex, stimulating the circulatory system; together with it, P has a corrective action on brain neurotransmitters. The consequence of all this is better oxygenation and toning of the nervous system.

SUGGESTIONS

In general, in all processes with nervous etiology.

Childhood processes: lack of concentration-attention.

Conduct disorders. Phobias, manias.

Night sweats.

Hyperactivity (HYPERKINETIC children). Childhood anxiety.

Mental exhaustion (examination).
