

## Monofloral Kanuka Honey 250 g from New Zealand

EAN: 9421905812900 FABRICANTE: MANUKA WORLD

*Monofloral Kanuka Honey from New Zealand. Less known than its first cousin the Manuka, but excellent in its condition.*

### DESCRIPTION

Unlike **Manuka honey**, **Kanuka honey** is not characterized by the presence of **MGO**, but due to its composition and proximity to **Manuka**, this superfood contains extra natural substances to support **immune stimulation** and achieve anti-inflammatory and healing effects when used topically. Having found valuable **benefits for skin problems such as acne, eczema and rosacea**. This honey is also collected in protected, remote and unspoiled areas of New Zealand. Each batch of honey is tested and certified to guarantee the quality, authenticity and natural bioactive power of this product.

Although the flowers of the Kanuka tree are smaller and tend to grow in groups unlike those of the Manuka tree, which has larger individual flowers, both are very similar in appearance, the main difference being the honey.

Also made by New Zealand bees and unlike Manuka honey, Kanuka honey is not characterized by the presence of MGO, but due to its composition and proximity to Manuka, this superfood contains extra natural substances to support immune stimulation and achieve anti-inflammatory and healing effects when used topically, having found valuable benefits for the skin. This honey is also collected in protected, remote and unspoiled areas of New Zealand.

Kanuka honey is an exceptional superfood for having the highest content of natural compounds called arabinogalactans (AGP) of all New Zealand honeys, including Manuka. AGP is important because it offers high anti-inflammatory properties for our skin in conditions such as acne, eczema or rosacea that seriously punish the skin.

Arabinogalactans (AGP), active ingredients present in this honey, are proteins found in the cell walls of plants. Being involved in many cellular processes, including cell division and death. According to studies carried out to verify the stimulating effect of Kanuka honey on the immune system, it has been observed that this honey contains a compound that can stimulate its cells to release cytokines called macrophages. Cytokines are proteins that contribute to **wound healing and repair**, or **inflammation**, indicative of a possible infection. These compounds are part of this honey naturally because they are present in the nectar of the Kanuka flowers.

## Monofloral Kanuka Honey 250 g from New Zealand

EAN: 9421905812900 FABRICANTE: MANUKA WORLD

Kanuka honey also contains a compound called Hydrogen Peroxide that gives it **antimicrobial** activity. This happens due to the oxidation power of hydrogen peroxide, which is capable of destroying the DNA of the bacteria present. On the contrary, in Manuka honey the production of hydrogen peroxide is suppressed due to the natural presence of Methylglyoxal (MGO) in the honey itself. Unlike hydrogen peroxide, MGO is resistant to digestion and hence its effectiveness in digestive problems. The main antibacterial activity of Kanuka honey is due to the hydrogen peroxide it contains. It has been shown that this ingredient can help eliminate bacteria such as E. Coli and S. Aureus.

Due to the benefits mentioned above, Kanuka honey is considered a better option compared to Manuka honey to help with skin conditions such as **acne, eczema, rosacea** and **cold sores**.

**Premium Monofloral Kanuka Honey from New Zealand**, contains natural **Arabinogalactan** protein (AGP), a natural compound present in authentic **New Zealand Monofloral Kanuka honey**, scientifically proven.

**100% natural Monofloral Kanuka Honey, unfiltered and unpasteurized.**  
Quality and origin guaranteed.

Not suitable for babies under 12 months.
