It is a combination of natural ingredients that have been studied and recognized for their effectiveness in treating candidiasis.

The ingredients of the formula have an antifungal, antibiotic, antioxidant and strengthening effect on the immune system, effects necessary to combat candidiasis.

Does Naturlider Candysin have side effects, interactions or contraindications?

Consult the professional in case of pregnancy or lactation, if you are being treated with medication or have special medical conditions.

MCT consumption is safe, and only high doses (greater than 30 grams) can cause gastrointestinal disturbances. Combining them with carbohydrates reduces these side effects. People with diabetes bad. Due to its content in Pau de Arco, it is recommended to carry out discontinuous treatments: up to 1 month and rest 2 weeks before a new intake. Cases of toxicity have always been related to the intake of products based on compounds isolated from the bark, and not with the drug. Taking into account some experiences in rodents, it should not be administered during pregnancy due to the risk of abortion and teratogenicity. It is also recommended not to prescribe it during lactation. Patients undergoing anticoagulant or antiplatelet treatment should refrain from taking this product without prior consultation with a physician, since naphthoquinones can increase said effect. Its simultaneous consumption with immunosuppressants can accentuate this last effect. On the other hand, the combination of sulfur compounds present in some plants (eg garlic, yerba mate) promote a catalytic base for the transformation of lapachol to β -lapachone. Patients consuming lapacho may have a darker coloration of urine.

Due to the antiplatelet effect of Clove, it could increase the risk of bleeding if it is taken concomitantly with anticoagulants and that can produce a false increase in phenytoin concentrations. However, these theoretical interactions do not interfere with its traditional use as an antiseptic in the form of mouthwashes.
