

Ecrisens 30ml

EAN: 8437020862066 FABRICANTE: PROSPERA BIOTECH

Ecrisens is a cream from Prospera biotech laboratories. Ecrisens is a dermatological cream that regulates perspiration and thus maintains the necessary degree of perspiration. Ecrisens has a gel-like texture that allows rapid absorption. Ecrisens does not stain clothing and is fragrance free.

DESCRIPTION

What is Ecrisens and what is it for?

Ecrisens is a neurodermatological gel that is used to control excessive sweating. The effects of Ecrisens begin to be observed after continued use, which may vary depending on the characteristics of each person and sweating conditions. Another factor to take into account is that Ecrisens regulates sweating by reducing excessive sweating, but leaving adequate perspiration.

- Maintains the level of sweating necessary for proper protection of the skin against excessive heat.
- It spreads and absorbs easily thanks to its light gel-like texture.
- It does not stain clothes or have a fragrance.
- Ecrisens can be used on armpits, hands, feet and face.

How many times a day should Ecrisens be used?

Ecrisens must be used twice a day for prolonged periods to see the effects. It can be used before or after other hygiene products, cosmetics or topical treatments.

What are the properties of Ecrisens?

The properties of Ecrisens are:

- Reduction of sweating.
- Hydration.
- Freshness and comfort

If you have excessive sweating or hyperhidrosis, in the armpits, hands, feet, face or other parts of the

body, which makes you uncomfortable in your social activities, work or daily tasks and worsens the appearance of your skin in these areas.

Ecrisens[®] is the alternative to antiperspirants: it regulates the activity of the eccrine gland and progressively restores the proper balance between sweating and thermal protection of the skin.

Ecrisens[®] is a neurodermatological gel that contains:

- A combination of neuromodulatory ingredients that acts synergistically on skin targets to help control excessive sweating and protect affected areas.
- A combination of dimethicones that provides softness to the formula and achieves a gelatinous texture that is quickly absorbed.

The mechanism of action of Ecrisens[®] does not block the pore or prevent the skin from breathing. Sweat is an essential mechanism to regulate body temperature. However, there are people who have excessive sweating levels that do not respond to this biological need.

Ecrisens[®] helps balance the skin's natural activity by maintaining thermoregulatory function and helping to control excessive sweating.

Ecrisens[®] acts only on the regulation of sweating, not on odor. Its use can be combined with deodorants and other topical products that reduce odor.

However, some people have experienced a reduction in odor as a result of reduced sweating.

In a study of Ecrisens[®] carried out by an independent company, under dermatological control in volunteers with excessive sweating:*

- It left a feeling of comfort and freshness in 100% of participants.
- Hydration of areas of excessive sweating improved in 100% of participants.
- 86% of participants reported feeling a reduction in sweating and an improvement in odor in the affected areas.
